Valium (Diazepam) is a prescription medication from the benzodiazepine class. It is commonly used to treat anxiety disorders, muscle spasms, alcohol withdrawal symptoms, and sometimes seizures. Valium works by calming the brain and nerves, helping the body relax. Its effects usually begin within 15–60 minutes and can last several hours.

How Valium Works

Valium enhances the activity of GABA, a natural chemical messenger in the brain that reduces nerve activity. By increasing GABA's calming effect, Valium helps reduce anxiety, relax muscles,

and control excessive brain activity. It is often used when anxiety or tension begins to affect daily life.
